"HUBUNGAN LAMA KERJA PERAWAT DENGAN KEPATUHAN PENERAPAN SURGICAL SAFETY CHECKLIST DI RUANG INSTALASI BEDAH SENTRAL (IBS)".

ABSTRAK

Latar Belakang: Keselamatan pasien merupakan prioritas utama dalam pelayanan bedah karena tindakan pembedahan memiliki risiko tinggi terhadap terjadinya komplikasi dan kejadian tidak diharapkan. Perawat memiliki peran penting dalam memastikan setiap tahapan checklist dilaksanakan secara konsisten dan sesuai prosedur. Lama kerja perawat diduga berhubungan terhadap tingkat kepatuhan dalam penerapan SSC karena berkaitan dengan pengalaman, keterampilan, dan pemahaman terhadap standar keselamatan pasien. Penelitian ini bertujuan untuk mengetahui hubungan antara lama kerja perawat dengan kepatuhan penerapan Surgical Safety Checklist di ruang Instalasi Bedah Sentral (IBS) RSUD dr. H. Jusuf SK Kota Tarakan.
Metode: Penelitian ini menggunakan desain kuantitatif deskriptif korelatif dengan pendekatan cross-sectional. Data karakteristik responden meliputi usia, jenis kelamin, dan tingkat pendidikan disajikan dalam bentuk distribusi frekuensi dan persentase. Lama kerja perawat dikategorikan menjadi ≤5 tahun, 6–10 tahun, dan ≥11 tahun. Kepatuhan penerapan SSC diobservasi pada tahap Sign-In, Time Out, dan Sign Out, kemudian dikategorikan menjadi rendah, sedang, dan tinggi. Analisis menggunakan uji Spearman-Rho ($\alpha = 0,05$).
Hasil: Hasil menunjukkan mayoritas perawat memiliki masa kerja ≥11 tahun (61,5%) dengan tingkat kepatuhan tinggi (84,6%). Uji Spearman-Rho menghasilkan p-value 0,017 dan koefisien korelasi 0,437, menunjukkan hubungan signifikan positif dengan kekuatan moderat.
Simpulan: Terdapat hubungan yang signifikan antara lama kerja perawat dengan kepatuhan penerapan *Surgical Safety Checklist* di ruang Instalasi Bedah Sentral (IBS) RSUD dr. H. Jusuf SK Kota Tarakan. Semakin lama masa kerja perawat, semakin tinggi tingkat kepatuhan dalam penerapan SSC.

Kata Kunci: lama kerja perawat, kepatuhan, *Surgical Safety Checklist*

"*THE RELATIONSHIP BETWEEN NURSES' WORKING LENGTH AND COMPLIANCE WITH THE IMPLEMENTATION OF SURGICAL SAFETY CHECKLIST IN THE CENTRAL SURGICAL INSTALLATION ROOM (IBS)*".

ABSTRACT

Background: Patient safety is a top priority in surgical care because surgical procedures carry a high risk of complications and adverse events. Nurses play a crucial role in ensuring that each stage of the checklist is implemented consistently and according to procedure. Nurses' length of service is thought to influence compliance with the SSC because it relates to their experience, skills, and understanding of patient safety standards. This study aimed to determine the relationship between nurses' length of service and compliance with the Surgical Safety Checklist in the Central Surgical Installation (IBS) of Dr. H. Jusuf SK Regional General Hospital, Tarakan City.

Methods: This study used a quantitative descriptive correlative design with a cross-sectional approach. Data on respondent characteristics, including age, gender, and education level, were presented in the form of frequency distributions and percentages. Nurses' length of service was categorized as ≤5 years, 6 – 10 years, and ≥11 years. Compliance with the SSC was observed at the Sign-In, Time-Out, and Sign-Out stages, and then categorized as low, medium, and high. Analysis used the Spearman-Rho test (α = 0.05).

Results: The majority of nurses (61.5%) had ≥11 years of service, with a high level of compliance (84.6%). The Spearman-Rho test yielded a p-value of 0.017 and a correlation coefficient of 0.437, indicating a significant positive relationship with moderate strength.

Conclusion: There is a significant relationship between nurses' length of service and compliance with the implementation of the Surgical Safety Checklist in the Central Surgical Installation (IBS) of Dr. H. Jusuf SK Regional General Hospital, Tarakan City. The longer a nurse's service period, the higher the level of compliance with the SSC implementation.

Keywords: nurse length of service, compliance, Surgical Safety Checklist
