Gambaran Kualitas Hidup Lansia dengan Hipertensi di Desa Tambahsari.

ABSTRAK

Latar Belakang : Hipertensi merupakan meningkatnya tekanan darah diatas ambang normal yakni lebih dari 140/90 mmHg. Hipertensi pada lansia dapat menyebabkan penurunan fungsi kognitif hingga mempengaruhi kualitas hidup. Peningkatan kualitas hidup lansia dilakukan untuk mengurangi angka morbiditas.

Tujuan : Untuk menggambarkan kualitas hidup lansia dengan hipertensi di Desa Tambahsari.

Metode: Deskriptif survei dengan pendekatan *cross sectional*. Penelitian dilakukan di Desa Tambahsari pada Mei 2021 hingga Juni 2021 yang melibatkan 92 responden.

Hasil : Lansia dengan hipertensi di Desa Tambahsari mayoritas berusia 70-74 sebanyak 32 lansia (34,8%), mayoritas lansia berjenis kelamin perempuan sebanyak 59 (64,1%), mayoritas pendidikan pada lansia SLTA/Sederajat sebanyak 54 (58,7%), mayoritas lansia tidak bekerja sebanyak 57 (61,9%), mayoritas lansia masih memiliki pasangan sebanyak 56 (60,9%), mayoritas lama menderita hipertensi pada lansia lebih dari 6 bulan sebanyak 78 lansia (84,8%) dan berdasarkan status minum obat pada lansia dengan hipertensi sebanyak 82 lansia (89,1%). Kualitas hidup lansia baik sebanyak 83 (90,2%).

Kesimpulan : Sebagian besar lansia dengan hipertensi yang ada di Desa Tambahsari memiliki kualitas hidup yang baik.

Saran : Keluarga dan tenaga kesehatan diharapkan mampu membantu lansia dalam meningkatkan kualitas hidup agar tekanan darah stabil sehingga mampu mencegah terjadinya komplikasi penyakit.
