BEHAVIORAL ANALYSIS OF IVA EXAMINATION SERVICE UTILIZATION AT PUSKESMAS BERGAS IN WOMEN OF CHILDBEARING AGE IN JATIJAJAR VILLAGE

ABSTRACT

Background: Puskesmas Bergas is one of the puskesmas that carries out IVA test services in Semarang Regency. The target of women of childbearing age for IVA examination in 1999 was women, 142 women who carried out IVA examination and 14 positive cases of IVA from 12 villages in the working area of Puskesmas Bergas. Karangjati Village has the highest IVA examination service utilization of 16 people and Jatijajar Village has a low coverage of 1 person. Based on the results of interviews with Jatijajar Village Midwives and 5 women of childbearing age, Jatijajar Village said that this was influenced by behavioral factors.

Objective: Analyze the utilization behavior of IVA examination services at the Bergas Health Center for women of childbearing age in Jatijajar Village.

Methods: Qualitative research methods. The population of all women of childbearing age in Jatijajar Village. The research subjects were 9 women of childbearing age in Jatijajar Village and 3 triangulation informants, namely village midwives, posyandu cadres, and IVA examination program coordinators.

Instruments with structured interview guidelines.

Results: Most respondents still do not know about the IVA program, but was attitude Most support the IVA program. There is easy access to services but access to information is still lacking. Puskesmas are expected to carry out health promotion using media such as leaflets, posters or leaflets, etc.

Suggestion: Puskesmas holds promotions related to IVA examination for women of childbearing age through various media such as leaflets, flyers or posters, etc.
