The Identification of Nurse Carrying out the Intervention of Falling risk for Schizophrenic Patients at RSJD Dr Amino Gondohutomo Central Java

xvi + 50 Pages + 8 Tables + 1 Charts + 14 Enclosure

Abstract

Background: Patient safety is one of the indicators of quality of service in hospital. The incident of patient falling is one of the indicators that represents the quality of care and problem that can be prevented. Carrying out the intervention for the risk of falling is crucial in ensuring the patient's safety, especially for the ones prone to fall. There are several aspects required for monitoring by nurse within the context of preventing the patient from falling. However, half of the nurses often found to be non-compliant in carrying out the intervention for the risk of falling for patients. **Research Objective:** Identifying the account of nurse carrying out the compliance in intervening the risk of falling. **Research Method:** The research is quantitative study with research design of descriptive study applying survei approach. Population for this research consisted of 130 respondents and sample is 98 respondent of nurses from the psychiatric ward. Samples were taken with the method of *Purposive Sampling*. **Results:** Based on the analytic test, it was found there were 78 nurses as respondent that were compliant in conducting intervention of the risk of falling, and nurses who were non-compliant in doing the intervention of the risk of falling were 20 respondents. **Conclusion:** The nurse's compliance in conducting intervention of the risk of falling found to be the majority and considered as good, which were 78 respondents (79,6%), Respondent who are non-compliant were 20 respondents (20,4%). **Suggestion:** Nurses should be more compliant in intervening for the prevention of the risk of falling in the schizophrenic patients.
