**An Overview of Cadres' Knowledge on Posyandu Competencies in the Era of  
Primary Health Care Service Transformation and Integration in Tegalrejo  
Village, Tengaran Community Health Center (UPTD Puskesmas Tengaran)**

**ABSTRACT**

Integrated Service Post (Posyandu) is one form of Community-Based Health Effort (UKBM) that is managed and implemented by, from, for, and with the community. In the era of transformation and integration of primary health services, the types of services provided at Posyandu have increased, requiring cadres to adjust their competencies accordingly. However, in practice, some cadres still lack mastery of their tasks, resulting in longer service times. This study aimed to analyze the knowledge of cadres regarding Posyandu competencies in the era of primary health service transformation in Tegalrejo Village, which can be utilized to contribute to the development of Posyandu services.

This research employed a descriptive quantitative design with a cross-sectional approach. The population consisted of 63 respondents from all Posyandu in Tegalrejo Village. The sampling technique used was total sampling, resulting in 63 respondents. Data analysis was carried out using univariate analysis.

The results showed that, in general, most respondents had good knowledge, with 55 (87.3%) categorized as good. In the competency of infants and toddlers, 54 (85.7%) were in the good category. For pregnant and breastfeeding mothers, 38 (60.3%) respondents had good knowledge. In the preschool and adolescent group, 41 (65.1%) respondents were in the fair category, and 4 (6.3%) were in the poor category. Meanwhile, in the adult and elderly group, 54 (85.7%) respondents were categorized as good. This study concludes that the overall knowledge of Posyandu cadres was good; however, in certain competency groups, some respondents still fell into the fair and poor categories, indicating a need for further improvement in understanding specific Posyandu competencies.
